**Geometry** Jun 04 2020 This book provides a systematic introduction to various geometries, including Euclidean, affine, projective, spherical, and hyperbolic geometries. Also included is a chapter on infinite-dimensional generalizations of

Euclidean and affine geometries. A uniform approach to different geometries, based on Klein's Erlangen Program is suggested, and similarities of various phenomena in all geometries are traced. An important notion of duality of geometric objects is highlighted throughout the book. The authors also include a detailed presentation of the theory of conics and quadrics, including the theory of conics for non-Euclidean geometries. The book contains many beautiful geometric facts and has plenty of problems, most of them with solutions, which nicely supplement the main text. With more than 150 figures illustrating the arguments, the book can be recommended as a textbook for undergraduate and graduate-level courses in geometry.

**Nonlinear Optical Waves** Jun 16 2021 A non-linear wave is one of the fundamental objects of nature. They are inherent to aerodynamics and hydrodynamics, solid state physics and plasma physics, optics and field theory, chemistry reaction kinetics and population dynamics, nuclear physics and gravity. All non-linear waves can be divided into two parts: dispersive waves and dissipative ones. The history of investigation of these waves has been lasting about two centuries. In 1834 J. S. Russell discovered the extraordinary type of waves without the dispersive broadening. In 1965 N. J. Zabusky and M. D. Kruskal found that the Korteweg-de Vries equation has solutions of the solitary wave form. This solitary wave demonstrates the particle-like properties, i. e. , stability under propagation and the elastic interaction under collision of the solitary waves. These waves were named solitons. In succeeding years there has been a great deal of progress in understanding of soliton nature. Now solitons have become the primary components in many important problems of nonlinear wave dynamics. It should be noted that non-linear optics is the field, where all soliton features are exhibited to a great extent. This book had been designed as the tutorial to the theory of non-linear waves in optics. The first version was projected as the book covering all the problems in this field, both analytical and numerical methods, and results as well. However, it became evident in the process of work that this was not a real task.

The Great Einstein Relativity Hoax and Other Science Questions, Hypotheses, and

Improbabilities Sep 27 2019 If you are looking for a top-rated science textbook, this is not the book for you. If you are looking for a reiteration of the historical progression of the physical sciences by a well-educated, experienced scientist, this book's not for you. However, if you are interested in considering logical thinking that is outside the scientific box and that challenges conventional science concepts, this may be the book for you. The entire first section presents a logical, convincing argument that concludes that the problem Einstein solved with his special theory of relativity never existed in the first place. There is nothing wrong with his reasoning or mathematical equations that address the problem he believed existed. There just was not a real problem to begin with. The whole section is an excellent tutorial on Einstein and relativity for anyone who is interested in understanding relativity, whether the reader agrees or disagrees with the conclusions. The second section is a tutorial on electrons and their role in the production of light, the reflection and refraction of light, and the role of electrons in the production of electricity, electronic device function, and heat. All tutorials are written in laymen's easy-to-read language. The third section examines many outside-the-box hypotheses in the realm of theoretical physics. This book is packed with easy-to-read nonmathematical explanations of physical phenomena, ranging from the appearance and properties of electrons to the construction of matter from particles and energy fields. Have you ever wondered what charge is or why electrons do not fly apart from internal repulsive forces or spiral into the nucleus of atoms? Is light a continuous wave

or pulses of electromagnetic field? Why do moving electromagnetic fields not have positive and negative charge or north and south poles? How does light reflect off itself? Why is your car battery attached to the body of the car? How do atoms attract to form molecules when their electrons repel one another? These and other questions are answered, often in unconventional ways, but others may not be answered at all. If you need a science research project or a dissertation idea, this book is for you. If you do not need it for a project but you just have an interest in better understanding science, this book is for you. If you have an open mind enough to at least consider alternate ways of thinking about scientific concepts and principles, this book is definitely for you.

**Stochastic Storage Processes** Mar 14 2021 A self-contained treatment of stochastic processes arising from models for queues, insurance risk, and dams and data communication, using their sample function properties. The approach is based on the fluctuation theory of random walks, Levy processes, and Markov-additive processes, in which Wiener-Hopf factorisation plays a central role. This second edition includes results for the virtual waiting time and queue length in single server queues, while the treatment of continuous time storage processes is thoroughly revised and simplified. With its prerequisite of a graduate-level course in probability and stochastic processes, this book can be used as a text for an advanced course on applied probability models.

Contributions Within Density Functional Theory with Applications in Chemical Reactivity Theory and Electronegativity Oct 28 2019 In the limits of the density functional theory there are introduced and deduced fundamental chemical descriptors as the chemical action concept, the chemical field, new electronegativity, rate reaction and chemical hardness formulations, the reduced total energy and the partial Hohenberg-Kohn functionals. For electronic density computations the quantum statistic picture of the path integral Feynman-Kleinert formalism is employed to its markovian approximation, providing the framework in which the majority of the chemical reactions and the reactivity of the electronic systems can be treated together with the internal and environmental couplings. Evaluation, representation and interpretation of the present analyzed chemical indices are performed for a prototype many-electronic system such that its electronic structure to display fundamental and excited anharmonic vibrations being in the thermal coupling with the medium. The chemical descriptors introduced and computed shall contribute to the foundation of the chemical reactivity on the conceptual and analytical physical bases, being able to predict the chemical transformations and the characterization of the bonds formation.
