Accessibility and Acceptability in Technical Manuals Jun 28 2022 "Accessibility and Acceptability in Technical Manuals" is written for an audience with a general interest in readability studies, linguistics and technical writing. With the main emphasis on technical manuals the book is primarily targeted at those who have a special interest in the design and use of utility texts and how these texts are received and

understood by a multifaceted audience. Accessibility is not a new research area and many explanations have been offered over the past years as to why non-experts often have difficulties in comprehending texts written by technological experts. This book offers a new approach to accessibility studies by exploring not only style, but also attitudes to style, by asking text consumers which style they prefer for different parts of the manual. A key role is played by the Systemic Functional Linguistics' notion of grammatical metaphor, a stylistic choice that is commonly used in technical literature. Grammatical metaphor although apparently obstructing the comprehension process of some readers is a common element in the preferred style that separates the insiders from the outsiders. An explanation of this rather surprising result is offered by resorting to Critical Discourse Analysis.

**When Computers Went to Sea** Sep 27 2019 When Computers Went to Sea explores the history of the United States Navy's secret development of code-breaking computers and their adaptation to solve a critical fleet radar data handling problem in the Navy's first seaborne digital computer system - that went to sea in 1962. This is the only book written on the United States Navy's initial application of shipboard digital computers to naval warfare. Considered one of the most successful projects ever undertaken by the US Navy, the Naval Tactical Data System (NTDS) was the subject of numerous studies attempting to pinpoint the reason for the system's inordinate success in the face of seemingly impossible technical challenges and stiff resistance from some in the military. The system's success precipitated a digital revolution in naval warfare systems. Dave Boslaugh details the innovations developed by the NTDS project managers including: project management techniques, modular digital

hardware for ship systems, top-down modular computer programming techniques, innovative computer program documentation, and other novel real-time computer system concepts. Automated military systems users and developers, real-time process control systems designers, automated system project managers, and digital technology

history students will find this account of a United States military organization's initial foray into computerization interesting and thought provoking.
